                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis lifection.

NB. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site.

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences ((II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) and infection, or they can be used to identify dry resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand

our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new and protein sequences given in the present invention, but which are not specifically mentioned within the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NESFTNFVKSK-----ADDINSLNDESKRKKLEEDINKLKKTLQLSFDLYNKYKLK 1014

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Q
```

```
The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

C (I) and (II) are useful for the development of vaccines against D. falciparum infection or a monochonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, attibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum of infection, or they can be used to identify drug resistance in sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AaA70078 to haA70287 and AAB18135 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   86;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             490

can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification. 72; secreted or membrane proteins) TFYNESFTNFVKSKADDINSL -- - NDESKRKKLEEDINKLKKTLQLSFDLYNKYKLKLER 1017 : | | | | | : : | | : | : | 328 IINKKKDRSRDTYEDESREGAYGENTTEDLNEDTQEGHKNKKKEILMNILYNDINIKKN 328 356 EIAKTIKFNIDSLFTDPLELEYYLREKNKNIDISAKVETKESTEPNEYPNGVTYPLSYND 415 471 268 723 427 781 900 240 DYIKKNKKTIENINEL----IEESKKTIDKNKNATKEEEKKKLYQAQYDLSIYNKQLEEA 295 296 HNLISVLEKRIDTLKKNENIKELLDKINEIKNPPPANSGNTPNTLLDKNKKIEEHEKEIK 355 ----INYNKKYEN 124 472 KSYEDRSKSLNDITKEYEKLLNEIYDSKFNNNIDLTNFE-----KMMGKRY---SYKV 521 EKLTHHNTFASYENSKHNLEKLTKALKYMEDYSLRNIVVEKELKYYKNLISKIENEIETL 581 619 VQKVLLMN------KIDELKKTQLILKN-VELKHNIHV-----PNSYKQENKQEPYYL 664 :| :: | :: | :: | | :: | | DEKDFF#DRNFKGKKKEIDIKKNQQV#KNMLNIKNNENIDVYNDKDNFINIDDKCPSGYF 416 IN----NALNELNSFGDLINPFDYTKEPSKNIYTDNERKKFINEIKEKIKIEKKKIESDK VENIKKD------EEQLFEKKITKD------ENKPDEKILEV--SDI-VKVQ 724 ALEGDSVQAQAQEQKQAQPPVPVPEAKAQVPTPPAPVNNKT--ENVSKLDYLEKLYEF 665 IVLKKEIDKLKVFMPKVESLINEEKKNI-KTEGQSDNSEPSTEGEITGQATTKPGQQAGS -----KDKIKEY----DYLDNEKOKNVNKMIHPKDGNNNNNNILLSQ----------NSSTILSHVVQEDYADGIKKF 782 LNTSYICHKYILVSHSTMN-EKILKQYKITKEEESKLSSCDPLDLLFNIQNNIPVMYSMF NKNSFYNN---LENRKLININNIYDKYKI------ILSEIKSG-----DSLNNSLSQLFMEIYEKEMVCNLYKLKDNDKIKNLLEEAKKVSTSVKTLSSSSMQPLSLT PQDKPEVSANDDTSHSTNLNNSLKLFENILSLGKNKNIYQELIGQKSSENFYEKILKDSD -------CDK------LDIK Length 2206; 515; Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           60;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system, such as peripheral nervous system, and a localised neuropathies and central nervous system diseases, aunch as lateral sclerosis, and SNy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed

```
infection, or they can be used to identify drug resistance in subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     their fragments (I) encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).
(I) and (II) are useful for the development of vaccines against antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of integs to treat or prevent P. falciparum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein sequences given in the present invention, but which are not

the inventor in transcript of conservative substitutions, derived from more standiate an immune response to substitutions, derived from more than one stage in a life cycle of a Plasmodium vivax parasite. (I) is comprises antigenic than one stage in a life cycle of a Plasmodium vivax parasite. (I) is specifically a protective immune response that confers increased resistance to infection by Plasmodium parasites, such as P. vivax. (I) is especially useful in the treatment, prevention and reduction of malarial infection, as conferring immunity against multiple stages of the malarial parasite. The antibodies produced are useful for the detection or measurement of antigenic epitopes derived from one or more stages in a life cycle of a parasite, particularly P. vivax. The vaccine comprising the recombinant proteins, is cost-effective, health-companies of the recombinant proteins, is cost-effective, health-companies of the recombinant proteins, is cost-effective, health-companies of the recombinant proteins, is cost-effective, health-companies of the recombinant proteins, is vaccined and and are in the present sequence represents the amino acid sequence of the recombinant protein vivacine and and and proteins vivax.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       285 --TLNDLETDYCTMDKCAGIFN--VVSNSLGLVILLYLATRANGAGNQPGANGAGNQPGI 340

The Bb polypeptides nes for eliciting protective antibodies to members of particularly for the use against Lyme disease in They can be used for preventing or attenuating an a member of the Borrelia genus. The products can also n of members of the Borrelia genus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervopathy and localised neuropathies and central nervous system diseases, such as Alaheimer's, Parkinson's disease, Huntington's disease, amyotrophic cutilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthitits and inflammation, leukaemias and CN.S disorders.

Note: The sequence data for this patent did not form part of the printed specification.

Also described are: (1) nuclectide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(1) and (II) are useful for the development of vaccines against

(2) falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum of the identification of drugs to treat or prevent P. falciparum of the identification of drugs to treat or prevent P. falciparum of the identification of drugs to treat or prevent P. falciparum of the identification of drugs to treat or prevent P. falciparum of proteins encoded by it will help to expand the subsequent identification of proteins encoded by it will help to expand complexity of the parasite biology, a process hampered by the complexity of the parasite lifecycle, and provide new targets for vaccine and drug development. Parasite resistance of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification. present invention describes proteins and their fragments (I) encod chromosome 2 of the human malarial parasite, Plasmodium falciparum Page 395-401; 577pp; English.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              57;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        įs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, plasmodium falciparum. Calso described are: (I) nucleotide sequences (II) encoded are: (I) nucleotide sequences (II) or (II).

Calso described are: (I) nucleotide comprising (I) or (II).

Cando (II) are useful for the development of vaccines against or infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in the customer of drugs and the consent identification of proteins encoded by it will help to expand or understanding of parasite biology, a process hampered by the cour understanding of parasite biology, a process hampered by the cour understanding of parasite biology, a process hampered by the cour understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for complexity of the parasitic lifecycle, and provide new targets for resistance to insecticides have led to a resurgence of malaria in many creasitance for the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AABI8144 to AABI8352 represent nucleotide

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of farugs to treat or prevent P. falciparum. Sequencing of the Plasmodium chromosome 2 and the csubsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite infecyle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many drugs. AaA70078 to AaA70287 and AAB18135 represent nucleotide and protein sequences given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                78;
